

Erhardt+Leimer develops advanced control panel RT4008

06/07/2010

The new E+L control panel RT4008 serves as interface between the operator and the machine. Therefore any source of error at this decisive position should be avoided to the greatest possible extent. The advanced design of the RT4008 was further developed to become still more user-friendly.

The following features characterize the control panel RT4008 of E+L:

- LCD color touch screen 320x240
- Hard keys for application functions
- Soft keys for menu guidance and interactive setup
- User-friendly arrangement of control components

During development of the new control panel RT4008 focus was put on clear setup and self-teaching, intuitive operation. On the big graphic display, for example, the selected application is displayed clearly by using 3-D pictures. As a result comprehensive information on the linked system is provided. The menus for the individual control components are visualized by means of graphic icons easy to understand. Another important progress: Since any warning notice, error message, or information is now displayed by means of self-explanatory icons, work process becomes much easier and less time-consuming for the operator. There is no more need to shift between the different languages. Apart from that, an integrated installation manager facilitates optimization of the control parameters during start-up.
